‘Standard-Essential Patents and Incentives for Innovation’

This paper presents a model of multiple innovators, whose resulting inventions may be (imperfect) complements or substitutes, and derive the value-sharing rules that maximise the expected social value of innovation. Under this framework, the paper examines an influential policy in the context of standard setting, that royalties for standard-essential patents should reflect the outcome of a hypothetical competition prior to standard setting, and shows that in the presence of both potential complements and substitutes, the competitive outcome provides suboptimal incentives for innovation.
